

# What is Malware protection?

Malware is the collective term for malicious software including viruses, Trojans and spyware that has been written and distributed to deliberately perform unauthorised functions. Protecting against such attacks should be one of the top priorities for your business.

What would happen if:

- 1 Your business was hit with a companywide virus?
- 2 Your main data storage computer was hacked into and the files released on the internet?

How much would that cost you in lost revenue and lost customer confidence? Would it stop your business trading until it is rectified? Would you incur fines for the breach?

These questions are not scare tactics; they are the unfortunately reality. Companies are being hit every single day, data is being ransomed and released every day.

There have been a lot of recent cases where organisations such as Police Forces and Hospitals have come under attack from Ransomware.

The normal method of attack of these types of virus's is through email and website ads. These attacks have cost these organisations thousands of pounds both in ransom payments and the clean-up operation.

## Ask Yourself

Does your business?

Have any malware protection installed?

Malware software that performs website black listing?

Malware software that automatically updates or conduct regular scans?

## Why Choose Axiom?

- We are a trusted provider of end-to-end cyber security solutions
- We tailor solutions to fit your needs
- We provide experienced consultants at all stages of any engagement.
- Our team understand the current cyber risk vulnerabilities and provide business solutions to mitigate these risks

**Malware Protection is one of the five key controls that form the focus of Cyber Essentials**
