

# What is Patch Management?

Patch management involves keeping the software used on computers and network devices up to date.

Security vulnerabilities are being discovered all the time, regularly deploying the manufacturers software updates (patches) will help reduce the risk of becoming the next victim of cyber-crime.

In our experience hackers will exploit software vulnerabilities in operating systems and applications if systems and applications are not regularly patched or updated.

## Ask yourself

Does your business?

Have a policy for how to handle software updates?

Remove old software that is no longer used?

Make time to deploy software updates?

## Why Choose Axiom?

- We are a trusted provider of end-to-end cyber security solutions
- We tailor solutions to fit your needs
- We provide experienced consultants at all stages of any engagement.
- Our team understand the current cyber risk vulnerabilities and provide business solutions to mitigate these risks

**Patch Management is one of the five key controls that form the focus of Cyber Essentials**
